Keynote Presentation: Visualization for Information Exploration and Analysis (Abstract) ................................................................. 7
  John Stasko

Papers

**Software Visualization for Understanding**
  *Session Chair: C. Hundhausen*

Assessing the Benefits of Synchronization-Adorned Sequence Diagrams: Two Controlled Experiments ............................... 9
  Shuaohua Xie, Eileen Kraemer, R.E.K. Stirewalt, Laura K. Dillon, Scott D. Fleming

Visualization of Exception Handling Constructs to Support Program Understanding ........................................................... 19
  Hina Shah, Carsten Görg, Mary Jean Harrold

Visual Analysis of Importance and Grouping in Software Dependency Graphs ............................................................... 29
  Christian Pich, Lev Nachmanson, George G. Robertson

Algorithm Visualization Using Concrete and Abstract Shape Graphs .................................................................................. 33
  Sascha A. Parduhn, Raimund Seidel, Reinhard Wilhelm

**Software Visualization for Testing and Debugging**
  *Session Chair: A. Telea*

Analyzing the Reliability of Communication between Software Entities Using a 3D Visualization of Clustered Graphs .... 37
  Dirk Zeckzer, Leon Schröder, Robert Kalcklösch, Hans Hagen, Timo Klein

HDPV: interactive, faithful, in-vivo runtime state visualization for C/C++ and Java ................................................................. 47
  Jaishankar Sundararaman, Godmar Back

Representing Unit Test Data for Large Scale Software Development .................................................................................... 57
  Joseph A. Cottam, Joshua Hursey, Andrew Lumsdaine

**Software Visualization for Maintenance**
  *Session Chair: J. Hosking*

An Interactive Reverse-Engineering Environment for Large-Scale C++ Code ................................................................. 67
  Alexandru Telea, Lucian Voinea

A Catalogue of Lightweight Visualizations to Support Code Smell Inspection ................................................................. 77
  Chris Parnin, Carsten Görg, Ogechi Nnadi

Classifying Desirable Features of Software Visualization Tools for Corrective Maintenance ............................................ 87
  Mariam Sensalire, Patrick Ogao, Alexandru Telea

Cluster Analysis of Java Dependency Graphs .................................................................................................................. 91
  Jens Dietrich, Vyacheslav Yakovlev, Catherine McCartin, Graham Jenson, Manfred Duchrow
## Table of Contents

### Software Visualization Interaction and Layout

*Session Chair: J. Stasko*

- Gef 3D – A Framework for Two-, Two-and-a-Half-, and Three-Dimensional Graphical Editors ................................................................. 95
  *Jens von Pilgrim, Kristian Duske*

- Automatic Layout of UML Use Case Diagrams ............................................................................................................................. 105
  *Holger Eichelberger*

- Improving an Interactive Visualization of Transitions Systems ........................................................................................................... 115
  *Bas Ploeger, Carst Tankink*

- Color Plate ......................................................................................................................................................................................... 221

### Joint Paper Session with VL/HCC

*Session Chair: A. Repenning*

- Streamsight – A Visualization Tool for Large-Scale Streaming Applications ........................................................................................................... 125
  *Wim De Pauw, Henrique Andrade, Lisa Amini*

- Software Visualization for End-User Programmers: Trial Period Obstacles ................................................................................................. 135
  *Neeraja Subrahmaniyan, Margaret Burnett, Christopher Bogart*

### Software Visualization for Design

*Session Chair: W. De Pauw*

- Visualizing Inter-Dependencies Between Scenarios ................................................................................................................................. 145
  *David Harel, Itai Segall*

- Visually Localizing Design Problems with Disharmony Maps ......................................................................................................................... 155
  *Richard Wettel, Michele Lanza*

- Stacked-widget Visualization of Scheduling-based Algorithms ................................................................................................................... 165
  *Tony Bernardin, Brian C. Budge, Bernd Hamann*

- Color Plate ......................................................................................................................................................................................... 223

### Software Visualization Applications

*Session Chair: E. Kraemer*

- Applying Visualisation Techniques in Software Product Lines ................................................................................................................. 175
  *Daren Nestor, Steffen Thiel, Goetz Botterweck, Ciarán Cawley, Patrick Healy*

- Signature Visualization of Software Binaries ......................................................................................................................................... 185
  *Thomas Panas*

- Supporting the Understanding of the Evolution of Software Items ......................................................................................................... 189
  *Roberto Theron, Antonio Gonzalez, Francisco J. Garcia*

- Rapid Visual Design with Semantics Encoding through 3d CRC Cards ....................................................................................................... 193
  *Anthony Savidis, Panagiotis Papadakis, George Zargianakis*
Table of Contents

Posters

A Landscape Metaphor for Visualization of Software Projects ................................................................. 197
Amaia Aguirregoitia Martínez, J. Javier Dolado Cosín, Concepción Presedo García

A Metro Map Metaphor for Visualization of Software Projects ................................................................. 199
Amaia Aguirregoitia Martínez, J. Javier Dolado Cosín, Concepción Presedo García

Combining Software Visualization Paradigms to Support Software Comprehension Activities .......................... 201
Glauco de F. Carneiro, Rodrigo Magnavita, Manoel Mendonça

Enhancing UML Sketch Tools with Digital Pens and Paper ........................................................................ 203
Raimund Dachselt, Mathias Frisch, Eike Decker

Texture-based Visualization of Metrics on Software Architectures .............................................................. 205
Heorhiy Byelas, Alexandru Telea

Towards Seamless Semantic Zooming Techniques for UML Diagrams ....................................................... 207
Mathias Frisch, Raimund Dachselt, Tobias Brückmann

VAST – Visualization of Abstract Syntax Trees within Language Processors Courses .................................... 209
Francisco J. Almeida-Martínez, Jaime Urquiaza-Fuentes, J. Ángel Velázquez-Iturbide

Visualizing the Computation Tree of the Tutte Polynomial ....................................................................... 211

Preface

Welcome to SOFTVIS 2008, the 4th ACM Symposium on Software Visualization. This symposium focuses specifically on visualization techniques that draw on aspects of software maintenance, program comprehension, reverse engineering, and reengineering. The high-level research question is “How visualization can help programmers understand and analyze large-scale software systems?”

We are very pleased to be part of the “Visual Week” held from September 15th to 19th 2008 in Herrsching am Ammersee, Germany. This event combines three conferences (IEEE Symposium on Visual Languages and Human-Centric Computing, Diagrams, and SOFTVIS), together with two workshops (Layout of Engineering Diagrams and Sketch Tools for Diagramming). “Visual Week” promises to be a veritable feast for the connoisseur of visual computing application, with a program that highlights the multiple uses of visual and interactive techniques in different areas of computing, including software engineering.

This year’s edition of SOFTVIS continues the tradition of co-location with the VL/HCC conference started at the previous edition in 2006. We have a joint technical paper session where representative papers from both events will be presented. Also, we share a joint keynote address delivered by John Stasko, and joint coffee breaks with the main conference of the Visual Week and a poster session and reception with the Graduate Consortium event. As with the previous edition, discounts for joint registrations were figured out by all the General Chairs of the Visual Week events. Mark Minas, the General Chair of VL/HCC, kindly helped us with managing the joint registration and logistics for all the involved events.

This year’s edition of SOFTVIS is marked by a number of innovations. First, we introduced the short paper category. Papers accepted in the short category were those that the program committee felt contained important contributions for the symposium, but that would require further technical work or maturity to warrant a full paper publication. Short papers were given 4 pages in the proceedings, as opposed to 10 pages for full papers. Second, for the first time in the history of SOFTVIS, we have full-color proceedings, which does proper justice to the highly visual content of the accepted papers.

This year there were 38 technical papers submitted. Each submission was reviewed by at least three members of the international program committee. On the basis of these reviews, the program committee accepted 16 full papers (42 percent acceptance rate) and 8 short papers for inclusion in the technical program and publication in the proceedings. Additionally, we continued the poster track established in previous editions of SOFTVIS. In all 9 poster papers were accepted for publication in the proceedings; these were presented in a special poster session held as part of the opening reception.

We would like to thank the program committee members and the additional reviewers for their diligence and attention to reviewing the submissions. Their input was extremely invaluable in making the exciting program we have this year. We also thank the SOFTVIS steering committee for their help and Advice with the organization of the conference. We thank Jochen Quante for his support in assisting us with EasyChair, the paper review system we used. We also wish to acknowledge the excellent support provided by Stephan Diehl with the symposium’s web page, and Stephen Spencer from ACM SIGGRAPH for managing the publication of the proceedings.

Last but not least, we greatly thank the General Chair of VL/HCC 2008, Mark Minas, for helping us with the co-location of SOFTVIS and for his help in organizing the local arrangements. We wish all participants an excellent Visual Week!

Abstract

Making sense of data becomes more challenging as the data grows larger and becomes more complex. If a picture truly can be worth a thousand words, then clever visualizations of data should hold promise in helping people with sense-making tasks. I firmly believe that visual representations of data can help people to better explore, analyze, and understand it, thus transforming the data into information. In this talk, I will explain how visualization and visual analytics help people make sense of data and I will provide many such examples. I also will describe my present research into visualization for investigative analysis. This project explores how visual analytics can help investigators examine a large document collection in order to discover embedded stories and narratives scattered across the documents in the collection.

1. Visualization for Understanding

The amount of electronic data available to people continues to grow and grow. Berkeley’s “How Much Information” project estimated that 5 exabytes (10^18 bytes) of information was produced in 2002 [1]. International Data Corporation estimated the digital universe to be 281 exabytes in 2007 [2]. But taken in its raw form, data in the digital universe is just that: raw data (text and numbers) that may or may not be useful to people. Thus, the goal of researchers such as myself is to help people transform the raw data into information that carries meaning, that assists decision-making, and that generates knowledge and wisdom.

Computational techniques and tools already have been very useful in the process of transforming data into information. For instance, spreadsheets provide structure and order on data that help us to examine and think about the data better. Computational algorithms for finding clusters and correlations in data provide us with useful meta-information about the characteristics of the data. Natural language parsing and understanding systems take raw text and extract useful features for further analysis. Data mining algorithms can identify specific data cases with particular characteristics that are difficult for us to determine in other ways.

My research focus, visualization, is another computational technique for transforming data into information. By visually depicting data in meaningful, expressive representations, we can translate it into a form that facilitates human exploration, analysis, and understanding.

The notion of visual imagery helping people to think is not new. Common clichés such as “Seeing is believing,” “I see what you’re saying,” or “A picture’s worth a thousand words” address this idea. More scientifically, visualization serves as an external cognition aid [3] and augments our memory as we perform cognitive operations [5].

But with other computational techniques and tools available, such as those mentioned earlier, when is visualization particularly useful? I believe that visual representations of data are particularly germane in situations involving unfamiliar data when a person is performing exploratory data analysis. In such situations, the person may not have a specific analytic goal in mind and may not have particular questions to be answered. Instead, the person is exploring the data, hoping to learn more about it and to discover “interesting” characteristics of the data. Throughout the exploration process, specific questions may arise and ideally the visualization will help to answer them, but the data analysis expedition likely did not initiate with all these questions in mind. Together with colleagues J.-D. Fekete, J. van Wijk, and C. North, I explore this “value of visualization” more fully in a recent book chapter [4].

In the academic community, the growing research areas of information visualization (infovis) and visual analytics address these very issues. Visual analytics augments ongoing infovis research on visual representations (and interactions) of data with studies of data transformations and analytical reasoning [9].
2. Investigative Analysis on Text

My recent research has focused on exploration and analysis of unstructured text document collections. Of the 281 exabytes of data estimated to exist by IDC in 2007, over 95% was said to be unstructured data [2]. Of course, much of this may be images, audio and multimedia, but an important percentage is likely text.

Together with my students at Georgia Tech, I have developed the Jigsaw system for assisting investigative analysis on text documents [7,8]. Jigsaw helps analysts with sense-making [6] activities, in particular, weaving together different chunks of information scattered across a variety of documents into a coherent story or narrative. Essentially, different documents will provide individual pieces of evidence that on their own may not be particularly illuminating. But when these individual pieces are considered together, they reveal a broader story and set of connected events. Such a capability could be useful for different types of analysts such as police investigators or news reporters.

Jigsaw provides multiple visualizations of the documents in a collection and the entities within the documents, such as people, places, organizations, phone numbers, etc. The system helps an investigator uncover and explore connections between entities across documents and it points the investigator to the documents to read next in a large collection. As such, it facilitates exploratory data analysis and sense-making activities on text documents.
